IMPORTANT SAFETY INSTRUCTIONS

1. READ these instructions.
2. KEEP these instructions.
3. HEED all warnings.
4. FOLLOW all instructions.
5. DO NOT use this apparatus near water.
6. CLEAN ONLY with dry cloth.
7. DO NOT block any ventilation openings. Allow sufficient distances for adequate ventilation and install in accordance with the manufacturer's instructions.
8. DO NOT install near any heat sources such as open flames, radiators, heat registers, stoves, or other apparatus (including amplifiers) that produce heat. Do not place any open flame sources on the product.
9. DO NOT defeat the safety purpose of the polarized or grounding type plug. A polarized plug has two blades with one wider than the other. A grounding type plug has two blades and a third grounding prong. The wider blade or the third prong are provided for your safety. If the provided plug does not fit into your outlet, consult an electrician for replacement of the obsolete outlet.
10. PROTECT the power cord from being walked on or pinched, particularly at plugs, convenience receptacles, and the point where they exit from the apparatus.
11. ONLY USE attachments/accessories specified by the manufacturer.
12. USE only with a cart, stand, tripod, bracket, or table specified by the manufacturer, or sold with the apparatus. When a cart is used, use caution when moving the cart/apparatus combination to avoid injury from tip-over.
13. UNPLUG this apparatus during lightning storms or when unused for long periods of time.
14. REFER all servicing to qualified service personnel. Servicing is required when the apparatus has been damaged in any way, such as power supply cord or plug is damaged, liquid has been spilled or objects have fallen into the apparatus, the apparatus has been exposed to rain or moisture, does not operate normally, or has been dropped.
15. DO NOT expose the apparatus to dripping and splashing. DO NOT put objects filled with liquids, such as vases, on the apparatus.
16. The MAINS plug or an appliance coupler shall remain readily operable.
17. The airborne noise of the Apparatus does not exceed 70dB (A).
18. Apparatus with CLASS I construction shall be connected to a MAINS socket outlet with a protective earthing connection.
19. To reduce the risk of fire or electric shock, do not expose this apparatus to rain or moisture.
20. Do not attempt to modify this product. Doing so could result in personal injury and/or product failure.
21. Operate this product within its specified operating temperature range.
Overview

General Description

The Shure Microflex Wireless Series (MXW) is a complete microphone solution for flexible meeting rooms and boardrooms. It features automatic RF channel management, rechargeable wireless microphones with encryption (AES256), and digital audio networking using Dante™.

The MXW Access Point (APT) mounts to a ceiling or wall for discreet communication between the wireless microphones and the digital audio network. Multiple access points can be used for installations that require simultaneous operation of up to 80 microphones in the same area, depending on the region. The MXW networked charging station charges and stores boundary and gooseneck microphones for tabletop applications, as well as handheld and bodypack solutions for corporate training and presentations. A web-browser control software is used for system setup and remote monitoring and control from any computer connected to the network.

Features

Legendary Shure Quality

| Premium Audio | All Microflex microphones are engineered to clearly capture the natural characteristics of voice communications, and include CommShield™ Technology which guards against unwanted radio interference from consumer wireless devices such as cell phones and tablets. |
| **Rechargeable Microphones** | Each MXW microphone is powered from a rechargeable Lithium-ion battery, which can be charged at any time without removal from the microphone. Battery statistics are viewable from the control software (battery runtime, time to full charge, charge cycle count and battery capacity). |
| **Discreet, Professional Design** | Modern, low-profile wireless microphone designs elegantly integrate into diverse AV environments. By eliminating wires, MXW noticeably reduces clutter and provides professional elegance. |
| **Encryption** | The MXW wireless link is encrypted using the Advanced Encryption Standard (AES-256), as specified by the US Government National Institute of Standards and Technology (NIST) publication FIPS-197. |

**Advanced Networking and Control**

| **Digital Audio Networking** | Digital audio is carried over standard Ethernet using shielded Cat5e (or higher) cables. Developed with Dante® technology by Audinate®, MXW provides low latency, clock synchronization, and high Quality-of-Service (QoS) to provide reliable audio transport. Digital audio can coexist safely on the same network as IT and control data, or can be configured to use a dedicated network. |
| **Automatic Frequency Coordination** | The MXW Series uses automatic frequency coordination to quickly set up all of the microphones and achieve reliable, uninterrupted wireless communication. Microphones are assigned to channels on an access point transceiver simply by arranging them in an associated charging station and pressing the Link button. Multiple access point transceivers can work together to support large installations or scalable rooms. Once Linked, the system automatically scans the available RF spectrum and selects the best quality RF channels on which to operate. Upon detecting interference, microphones automatically switch to the best alternate RF channel determined during continuous background scanning. |
| **Remote Control and Monitoring** | Microflex Wireless components and software are compatible with Crestron, AMX, and other programmable controllers. Components interconnect with teleconferencing equipment and digital signal processors. |
| **Built-In RF Spectrum Scanner** | The MXW Wireless components transmit in unlicensed spectrum that may be used by other wireless devices (in particular wireless phones and headsets) operating in the same area. The MXW access point features an RF scanner to document the average and peak RF interference. The data provides an accurate estimate for the number of MXW channels that can be safely operated in the scanned area. |
MXW Wireless System

Components of the MXW System

Microphone Transmitters

MXW microphones transmit an encrypted, wireless audio signal to the access point. Four form factors are available:

<table>
<thead>
<tr>
<th>Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hybrid Bodypack (MXW1)</td>
<td>The bodypack secures to a belt or strap for hands-free, mobile communication. It features a TQG input for lavalier connection and an integrated omnidirectional microphone.</td>
</tr>
<tr>
<td>Handheld (MXW2)</td>
<td>The handheld enables presenters to communicate using legendary Shure SM58, SM86, BETA58 and VP68 microphone cartridges.</td>
</tr>
<tr>
<td>Boundary (MXW6/C, MXW6/O)</td>
<td>The boundary transmitter sits on a table or desk to transmit speech while discreetly blending into any conference environment.</td>
</tr>
<tr>
<td>Desktop Gooseneck Base (MXW8)</td>
<td>The gooseneck base is compatible with 5, 10, and 15&quot; Microflex gooseneck microphones.</td>
</tr>
</tbody>
</table>

The MXW, MXW6, and MXW8 microphones include a headphone output for monitoring audio, such as a translation channel.
Access Point Transceiver (*MXWAPT2, MXWAPT4, MXWAPT8*)

The Access Point Transceiver (2, 4 and 8 channel units) mounts to a wall or ceiling to manage encrypted, wireless audio connections with microphones. As a system hub, it transports digital audio between the wireless microphones and other Dante devices on the same network. The APT includes a webserver that hosts the MXW System control software, used for monitoring, configuration, and remote control of the system.

Audio Network Interface (*MXWANI4, MXWANI8*)

The Audio Network Interface (4 and 8 channel) is a Dante network device that provides analog audio input and outputs for the MXW system. It has a 4-port Gigabit Ethernet switch that enables the connection of an MXW access point, a computer and up to two MXW networked charging stations.
Networked Charging Station \textit{(MXWNCS2, MXWNCS4, MXWNCS8)}

The Networked Charging Station (2, 4 and 8 slot varieties) is capable of simultaneous charging MXW microphones. It also links microphones to access point channels and networks battery statistics to the control software.

\textit{Note: The MXWNCS2 does not work with the MXW8 gooseneck microphones.}

MXW Control Software

The MXW control software offers comprehensive remote control of key setup, monitoring and management functions. The software is accessible from any computer on the network, and opens in a web-browser using Adobe\textsuperscript{®} Flash\textsuperscript{®}. 
**Important:** Desktop Gooseneck Base Microphones (MXW8) occupy two charging slots. For example, eight MXW8 microphones require two MXWNCS8 charging stations (16 charging slots total).

**System Design and Technology**

**Technology Overview of the Audio Path**

The MXW System combines Shure legendary audio quality with advanced digital networking technology. The following is an overview of the audio path:

**Wireless Audio**

The MXW transmitter converts speech into a digital signal that is transmitted wirelessly to the access point.

- Intelligent, automatic wireless audio management using the Digital Enhanced Cordless Telecommunications (DECT) framework
- Custom RF design enables higher audio quality and lower latency than most DECT systems

**Digital Audio Network**

The access point receives wireless audio from the microphones and distributes it to the audio network interface.

- Low latency, tight clock synchronization, and high Quality-of-Service (QoS) provide reliable audio transport.
- Digital audio is carried over Ethernet cables and standard IP equipment.
- Audio coexists safely on the same network as IT and control data, or can be configured to use a dedicated network.

**Analog Audio**

The audio network interface converts network audio for each channel into analog outputs.

- Sends analog audio to a mixer, Digital Signal Processor (DSP), or teleconferencing device.

**Forming Groups and Linking Microphones**

Once all the MXW components are connected to the network, they can be associated into Groups from the Configuration tab of the control software. Each Access Point can form an association Group with one or two chargers (for Linking microphones) and one or two audio output devices (for routing audio to analog outputs). The microphones can then be placed in the charger and Linked to these access point channels.

Each Group is managed by a single access point. Microphones are Linked to channels in the access point, not to the charger that was used to Link them. This relationship persists until the microphones are re-Linked or the access point is reset.

**Configurations: Managing Multiple Groups**

Configurations allow multiple Groups to share the same preferences and global controls. When an additional Group is added to a Configuration page, a relationship is established across all devices in the configuration. The new Group will take on the settings of that configuration.

For specialized applications such as multiple room setup, several configurations can be created to independently control component Groups.
Hardware Description

Audio Network Interface (ANI)

Front Panel

1. Input Channels

   Adds analog line- or aux-level signals to the digital network. When the device is associated to an MXW Group, inputs are automatically routed to Linked microphone channels (Input A to channels 1-4; Input B to 5-8).

2. Output Channels

   Converts digital network audio to an analog output for each channel. When associated to an MXW group, access point channels are automatically routed to the outputs of the ANI.

3. Channel Selector

   Selects a channel to perform the following functions:

<table>
<thead>
<tr>
<th>Action</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single Press</td>
<td>Listen to that channel at the headphone jack</td>
</tr>
<tr>
<td></td>
<td>Display and adjust the channel output level and attenuation</td>
</tr>
<tr>
<td></td>
<td>Monitor output signal on the level meter</td>
</tr>
<tr>
<td>Press and Hold (3 seconds)</td>
<td>Mute/unmute a channel. Mute is indicated by the mute LED.</td>
</tr>
</tbody>
</table>

4. Selected Channel LED

   Illuminates when a channel is selected.

5. Signal Strength LED (sig/clip)

   Indicates audio signal strength for each channel:
   - Green = Normal
   - Amber = Strong
   - Red = Clipping (to eliminate clipping, attenuate the signal level at the audio source)

6. Mute LED

   Illuminates red when the channel output is muted (hold its channel select button for 3 seconds). A muted channel is still routed to the HEADPHONE jack for monitoring or troubleshooting.
① Input Level Selector
Set the selected channel to line- or aux-level to match the input signal.

② Output Level Selector
Set the selected channel to an output level that matches the connecting device:
- line: +4 dBu
- aux: -10 dBV
- mic: -30 dBV

③ Output Attenuation Control
Use the up/down buttons to attenuate the channel output from 0 dB (no attenuation) to -24 dB in 1 dB increments, and from -24 to -78 in 3 dB increments.

④ Level Meter
Displays a selected channel's audio level in dBFS. It is good practice to use -18 dBFS on the output meter as an approximation of 0 VU on an analog meter.

⑤ Hardware Status LEDs
Indicate the status of the hardware:

<table>
<thead>
<tr>
<th>LED</th>
<th>Color</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Power</td>
<td>Green</td>
<td>Unit is powered on.</td>
</tr>
<tr>
<td>Ethernet</td>
<td>Green</td>
<td>Connected to an Ethernet device.</td>
</tr>
<tr>
<td>Network Audio</td>
<td>Green</td>
<td>All connected receive channels are OK (receiving digital audio as expected).</td>
</tr>
<tr>
<td></td>
<td>Flashing Green</td>
<td>One or more connected receive channels experiencing a subscription error or is unresolved (transmitting device is off, disconnected, renamed or has incorrect network setting).</td>
</tr>
<tr>
<td></td>
<td>Off</td>
<td>No receive channels connected (routing has not been established).</td>
</tr>
<tr>
<td>Lockout</td>
<td>Red</td>
<td>Front panel gain and mute controls are locked. The LED will blink when a button is pressed while the hardware is locked.</td>
</tr>
</tbody>
</table>

⑥ Headphone Volume Knob
Adjusts the volume to the headphone output.

⑦ Headphone Output
1/4" (6.35 mm) output jack for monitoring audio going to and from the digital audio network.

Note: Audio is present only when the unit is connected to a digital audio network.
Back Panel

① AC Power
IEC connector 100 - 240 V AC.

② Power Switch
Powers the unit on or off.

③ Output Block Connectors (1-8)
Three-pin, low-voltage differential connector provides a line-, aux- or mic-level analog output for each channel.

④ Chassis Ground (1-8)
Use to directly ground the cable shield to the chassis.

⑤ Input Block Connectors (A,B)
Three-pin, low-voltage differential input connector adds line- or aux-level analog signals to the digital network.

Note: This input is meant for balanced connection. If an unbalanced source is used, such as an IPOD or MP3 player, only use pins 1 (signal) and 3 (ground) of the block connector. See Specifications sections for wiring diagrams.

⑥ Reset Button
Press and hold the button for five seconds to reboot the device with factory default settings.

⑦ Ethernet Status LED (Green)
- Off = no network link
- On = network link established
- Flashing = network link active

⑧ Ethernet Link Speed LED (Amber)
- Off = 10/100 Mbps
- On = 1 Gbps (required for digital audio routing)

⑨ Network Interface
Four-port gigabit switch for connecting components together for a single MXW Group, or for connecting multiple devices to a larger digital audio network. The following is a description of each port:

<table>
<thead>
<tr>
<th>Port</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port 1 (PoE)</td>
<td>Provides Power over Ethernet (PoE) for the Shure access point and functions as a standard gigabit port.</td>
</tr>
<tr>
<td>Port</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Ports 2 and 3</td>
<td>Standard gigabit ports enable the connection of another MXW network, additional MXWANIs, a MXWNCS charging stations or an external control system.</td>
</tr>
<tr>
<td>Port 4 (Uplink)</td>
<td>Normal mode (default): this port functions the same as ports 2 and 3. Uplink Mode: only transports control data. This mode blocks network audio and data for Shure Web Discovery Application, Dante Controller and Dante Virtual Soundcard.</td>
</tr>
</tbody>
</table>

## Access Point Transceiver (APT)

The access point transceiver is the hub of the audio signal flow and manages the RF stability of each microphone in the group. The APT performs the following functions:

- Receives and decrypts wireless audio signals from microphones in the group
- Delivers the audio signal to the digital audio network and audio network interface (ANI)
- Hosts an embedded web server that provides access to the control software used to manage the MXW system
- Sends and receives control information (such as gain adjustment and link settings) between the components, MXW control software and 3rd party controllers.
- Transmits an encrypted audio signal to the microphone’s headphone output for listening to translated audio or other external sources.

### Model Variations

<table>
<thead>
<tr>
<th>Model</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MXWAPT8</td>
<td>Eight-channel transceiver</td>
</tr>
<tr>
<td>MXWAPT4</td>
<td>Four-channel transceiver</td>
</tr>
<tr>
<td>MXWAPT2</td>
<td>Two-channel transceiver</td>
</tr>
</tbody>
</table>

1. **Power LED**
   - Illuminates green to indicate the presence of Power over Ethernet (PoE).

2. **Network Audio LED**
<table>
<thead>
<tr>
<th>Color</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>All routed receive channels are OK (receiving digital audio as expected).</td>
</tr>
<tr>
<td><strong>Flashing Green</strong></td>
<td>One or more connected receive channels experiencing a subscription error or is unresolved (transmitting device is off, disconnected, renamed or has incorrect network setting).&lt;br&gt;Receiving an Identification signal from the control software (simultaneous flash with Link Status LED).&lt;br&gt;The device is performing a spectrum scan (alternating flash with Link Status LED).&lt;br&gt;Clock synchronization problem.</td>
</tr>
<tr>
<td>Off</td>
<td>No receive channels connected (routing has not been established).</td>
</tr>
</tbody>
</table>

Note: the network audio status can be monitored in detail from Dante Controller software.

③ Microphone Link Status LED

<table>
<thead>
<tr>
<th>Color</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Green</td>
<td>≥1 microphone is linked and powered on in the Active, Mute or Standby state.</td>
</tr>
<tr>
<td>Off</td>
<td>≥1 microphone is linked and is Off or in a non-networked charger.</td>
</tr>
<tr>
<td>Red</td>
<td>No microphones have been linked.</td>
</tr>
<tr>
<td><strong>Flashing Red</strong></td>
<td>Receiving an Identification signal from the control software (simultaneous flash with Network Audio LED).&lt;br&gt;The device is performing a spectrum scan (alternating flash with Network Audio LED).</td>
</tr>
</tbody>
</table>

④ Reset Button

Press and hold the reset button for 10 seconds to reset the MXW system to factory default settings.

Note: The reset deletes group association and microphone links, and will reboot the device in DHCP mode.

⑤ Ethernet Port

Connect a shielded Cat5e (or higher) cable to a PoE source and the network.

⑥ Ethernet Status LED (Green)

- Off = no network link
- On = network link established
- Flashing = network link active

⑦ Ethernet Link Speed LED (Amber)

- Off = 10/100 Mbps
- On = 1 Gbps (required for proper MXW functionality)

⑧ Cable Routing Path

Provides a path for the Ethernet cable to enable a flush-mount to the ceiling or wall.
Directional Antennas
The access point contains multiple directional antennas to provide steady, reliable wireless communication with the microphones. It sends and receives the RF signal in a cardioid pattern with the greatest sensitivity toward the face of the device. Always aim this side toward the microphone coverage area.

Networked Charger (NCS)
The MXW networked charging station enables battery charging and channel linking from a single location. When a charger is associated to a group, its channel slots are mapped to access point audio channels. Microphones can then be placed in the slots to Link to these channels.

Any microphone can recharge in any NCS, regardless of Group association or network connection.

**Caution:** When the Link button on an associated charger is pressed, all microphones in the charger are mapped to channels on an access point. This overrides any previously Linked microphones on those channels.

Model Variations

<table>
<thead>
<tr>
<th>Model</th>
<th>Accepts</th>
</tr>
</thead>
<tbody>
<tr>
<td>MXWNCS8</td>
<td>eight boundary, bodypack, or handheld microphones or four gooseneck bases</td>
</tr>
<tr>
<td>MXWNCS4</td>
<td>four boundary, bodypack, or handheld microphones or two gooseneck bases</td>
</tr>
<tr>
<td>MXWNCS2</td>
<td>two boundary, bodypack, or handheld microphones. MXW8 Gooseneck bases are not supported on this charger</td>
</tr>
</tbody>
</table>
① Charging Slots (USB 3.0 Type A)

Recharge and link microphones by connecting them to the USB slots on the charger. When the charger is associated to a group, the slots are mapped to access point channels (See Audio Channel Assignment for details).

*Note:* Any microphone can charge in any charger, regardless of Group association or network connection.

② Power LED

Illuminates green when the unit is powered on.

③ Microphone Link LED

Indicates the status of the Linking procedure:

<table>
<thead>
<tr>
<th>Color</th>
<th>Indicator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off (default)</td>
<td>No Link has been initiated.</td>
</tr>
<tr>
<td>Flashing Green</td>
<td>Link procedure is in process.</td>
</tr>
<tr>
<td>Green</td>
<td>Microphones have been successfully linked to channels.</td>
</tr>
<tr>
<td>Red</td>
<td>Link procedure unsuccessful (RF issue, network failure, or microphones removed during procedure)</td>
</tr>
<tr>
<td>Amber</td>
<td>Link procedure cannot start because the station is not associated to a group.</td>
</tr>
<tr>
<td>Flashing Red</td>
<td>Link procedure has been locked from the control software.</td>
</tr>
<tr>
<td>Blue</td>
<td>Charger is in High Efficiency Mode.</td>
</tr>
</tbody>
</table>

④ Microphone Link Button

- Press and hold for 6 seconds to link all microphones in the charger to channels of the associated Access Point Transceiver.
- Within the first minute of powering up the charger, press and release the Link button 3 times in succession to place the charger in High Efficiency Mode. You must power cycle the charger to return to standard charging mode.

⑤ Battery Status LEDs
Monitors the charge status of the connected microphone in increments of <10, 10, 25, 50, 75, 100% (see Batteries for more detail). Additionally, the five LEDs flash for several seconds when the microphone has been successfully linked to the channel.

6. **Locking DC Power Supply**
Secures the PS60 power supply to the input jack of the station.

7. **Power Switch**
Powers the unit on or off.

8. **Ethernet Port**
Connects to the MXW System network through an MXW Audio Network Interface or a switch using an Ethernet cable.

9. **Ethernet Status LED (Green)**
- Off = no network link.
- On = network link established.
- Flashing = network link active.

10. **Ethernet Link Speed LED (Amber)**
- Off = 10 Mbps
- On = 100 Mbps

### Connecting Microphones
Place a microphone in the charger by connecting it to one of the channel slots. The channels in the top row have two USB ports to accommodate different types of microphones. Do not attempt to connect to both USB ports at the same time.

*Note: 2-channel chargers do not support gooseneck microphones.*

- Handheld, boundary and bodypack: use the main vertical slots in the recessed bays.
- Gooseneck base: uses the top row's horizontal connectors.

### Different Connectors for the Same Channel

### Microphone Transmitters

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. <strong>Power Button</strong></td>
</tr>
</tbody>
</table>
MXW6, MXW8: Press and hold the dedicated power button for three seconds to turn the transmitter on or off.
MXW1, MXW2: Press and hold the Mute/Active button for five seconds to turn the transmitter on or off.

② Mute/Active Button

Changes the audio status from Active to Mute, or Mute to Active. The button behavior for each transmitter type can be set independently from the Preferences tab. The following describes the function of each setting:

- **Toggle**: Press and release the button to change the status to Active or Mute.
- **Push-to-talk**: Hold button to pass audio.
- **Push-to-mute**: Hold button to mute the audio.
- **Disabled**: The button does not affect the audio.

③ Status LED

Indicates the transmitter’s status. The color indicators for Mute and Active can be customized from the Preferences tab. See the Status LED table for the default LED behavior for MXW transmitters except the gooseneck light-ring models (MX405R/410R/415R).

④ Low Battery LED (Gooseneck and Boundary only)

<table>
<thead>
<tr>
<th>Color</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>&lt;5% battery runtime remains</td>
</tr>
<tr>
<td>Solid Red</td>
<td>&gt;5% battery runtime remains</td>
</tr>
</tbody>
</table>

⑤ Earphone Jack

1/8” (3.5 mm) jack for monitoring a return channel signal, such as translated audio. This audio is automatically routed from the input(s) of the Audio Network Interface (Input A to channels 1 - 4; Input B to channels 5 - 8).

*Note: Not featured on the MXW2 handheld transmitter.*

⑥ Charge Connector (USB 3.0 Type A)

Connects to the NCS charger slot or to the USB Charger.

⑦ Handheld Cartridge

MXW2 transmitter is compatible with the following cartridge types: SM58, Beta 58, SM86, VP68.

⑧ Gooseneck Microphone

The gooseneck base is compatible with 5, 10, and 15” Microflex gooseneck microphones.

⑨ TQG Connector

The MXW hybrid bodypack has a TQG connector for an external lavalier or headset microphone.

⑩ Internal Microphone

The bodypack transmitter has an internal, omnidirectional microphone that can be set to automatically engage when not connected to a lavalier microphone.
## Status LED Table

<table>
<thead>
<tr>
<th>Status</th>
<th>LED</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Green</td>
<td>Ready to pass audio to network.</td>
</tr>
<tr>
<td>Mute</td>
<td>Red</td>
<td>Audio is muted.</td>
</tr>
<tr>
<td>Standby</td>
<td>Red Pulsing (long off, short on)</td>
<td>Audio is muted and the transmitter is in a hibernation state to conserve the battery.</td>
</tr>
<tr>
<td>Identify</td>
<td>Flashing Yellow</td>
<td>The Identify button has been pressed from the control software.</td>
</tr>
<tr>
<td>Initialization/ RF channel</td>
<td>Alternating Red and Green</td>
<td>The transmitter is initializing and acquiring the RF connection to the linked access point.</td>
</tr>
<tr>
<td>Out of RF Coverage Range</td>
<td>Red Pulsing (short on/off)</td>
<td>The transmitter is out of the RF coverage range to the linked access point.</td>
</tr>
<tr>
<td>Charging</td>
<td>Off</td>
<td>The transmitter is charging.</td>
</tr>
<tr>
<td>Battery Statistics Reset</td>
<td>Flashing Yellow</td>
<td>Battery statistics have been reset for the transmitter.</td>
</tr>
<tr>
<td>Two microphones trying to connect to same audio channel</td>
<td>Red Pulsing (long on, short off)</td>
<td>Only one microphone for each audio channel can be active at a time.</td>
</tr>
<tr>
<td>Off</td>
<td>Off</td>
<td>No connection to the network. The transmitter must be turned on using the power button on the mic.</td>
</tr>
</tbody>
</table>

## Microphone Transmitters

MXW microphones transmit an encrypted, wireless audio signal to the access point. Four form factors are available:

### Hybrid Bodpack (MXW1)

The bodpack secures to a belt or strap for hands-free, mobile communication. It features a TQG input for lavalier microphone connection and an integrated omnidirectional microphone.
Wearing the Bodypack Transmitter

- Clip the transmitter to a belt or pocket.
- For best results, the belt should be pressed against the base of the clip.

Handheld (MXW2)

The handheld enables presenters to communicate using legendary Shure SM58, SM86, BETA58 and VP68 microphone cartridges.
Correct Microphone Placement

- Hold the microphone within 12 inches from the sound source. For a warmer sound with increased bass presence, move the microphone closer.
- Do not cover grille with hand.

Boundary (MXW6/C, MXW6/O)

The boundary transmitter sits on a table or desk to transmit speech while discreetly blending into any conference environment. Cardioid and omnidirectional versions are available.

Microphone Placement

For best low-frequency response and rejection of background noise, place the microphone on a large, flat surface, such as a floor, table, or lectern.

To reduce reverberance, avoid reflective surfaces above or to the side of the microphone, such as beveled sides of pulpits or overhanging shelves.
Desktop Gooseneck Base (MXW8)

The gooseneck base is compatible with 5, 10, and 15" Microflex gooseneck microphones.

Microphone Types

Insert Microphone into Base
Bi-color Status Indicator

MX405, MX410 & MX415

MXW1 bodypack

MX405R, MX410R & MX415R

Light Ring

Models

<table>
<thead>

</tbody>
</table>

Networked Charging Station (NCS)

Slide the transmitter into the charging slot until it secures into place. The charge LEDs illuminate when the charge cycle begins. Regardless of Group association or network connection, any microphone can recharge in any NCS.

- Handheld, boundary and bodypack: use the main vertical slots in the recessed bays.
- Gooseneck base: uses the top row's horizontal connectors. (Not included on two-channel chargers).

Charge Status LEDs

Each charger channel has a row of LEDs that illuminate to indicate the microphone battery charge level:

<table>
<thead>
<tr>
<th>LED</th>
<th>% Battery Charge</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Flashing: &lt;10%</td>
</tr>
<tr>
<td></td>
<td>Solid: &gt;10%</td>
</tr>
<tr>
<td>2</td>
<td>&gt;25%</td>
</tr>
<tr>
<td>3</td>
<td>&gt;50%</td>
</tr>
<tr>
<td>4</td>
<td>&gt;75%</td>
</tr>
<tr>
<td>5</td>
<td>&gt;95%</td>
</tr>
</tbody>
</table>
Note: The LEDs do not illuminate in Energy Efficient Mode.

NCS Power Modes

The charging station can be operated in different power modes other than standard charging mode:

Energy Efficient Mode

Operate the charger in a low-energy mode to reduce power consumption. In this mode, only one LED indicator illuminates per channel after powering on.

To change to Energy Efficient Mode:

1. Open the MXW control software to the Utility page.
2. Open the Device Properties window for the charging station.
4. Select Add updates to exit the device properties.
5. Select Apply All from the Utility page to push to your devices.

High Efficiency Mode

Operate the charger in high-efficiency mode to greatly reduce power consumption. In this mode:

- The Ethernet and charging LED indicators functions are disabled.
- The Power LED illuminates green.
- The Link LED illuminates blue, indicating High Efficiency Mode.

To change to High Efficiency Mode:

- Within the first minute of powering up the charger, press and release the Link button three times in succession.
- To return the charger to standard charging mode, power cycle the charger.

Notes:

- Shure rechargeable batteries require approximately 4 hours to fully recharge in High Efficiency Mode.

  Important: Because the charging LED indicators are disabled in High Efficiency Mode, you must manage the 4-hour recharge time using your own timer.

- While in High Efficiency Mode, there is no Ethernet connectivity for the charger. There is no monitor and control functionality for SystemOn or any other connected solutions like Crestron/AMX.
- When a Charger transitions to High Efficiency Mode, any microphones currently docked in the charger also transition to High Efficiency Mode (identified by the removing the microphone from the charger and observing that the microphone is powered off).
- After a power cycle of a charger in High Efficiency Mode, the charger visually indicates standard charging and any microphones removed from the charger follow the configured Initial State from Charger preference in the APT configuration.
- A microphone docked in a charger that is in High Efficiency Mode, which has not yet reached full charge, supports the legacy battery cycle count reset mechanism (hold mute button for 10 seconds to trigger cycle count reset). The microphone does not support this mechanism if a full charge has been reached.

  Note: You should only use the battery cycle count reset after installing a new battery.

USB Charger

The USB Charger (SBC-USB) can connect to an MXW transmitter to provide power during operation.
Battery Statistics on Control Software

The MXW control software is used to manage battery information. Use the Monitor tab to view battery charging status:

In the Charging Station

Displays the remaining time until the microphone battery is fully charged.

During Use

Displays the remaining battery runtime of the microphone.

For battery health statistics, use the Utility tab:

Battery Statistics

Battery Capacity

The microphone battery’s percentage of charge capacity as compared to a new battery.

Cycle Count

Number of charge cycles logged by the battery.

Reset the Microphone Battery Statistics

After installing a new battery, reset the battery health statistics that are stored in the microphone.

1. Place the transmitter with a new battery into a charging slot. You can use any powered MXW charging station.
2. Press and hold the mute button on the microphone until its LED flashes (~10 seconds).
**Caution:** Securely hold the microphone while pressing the button to avoid damaging the USB ports on the charging station.

**Maximizing Battery Life**

While the rechargeable Li-Ion batteries for MXW transmitters are designed to last up to 9 hours on a charge, variance in battery health and use-case may result in significant differences in battery runtime. Specifically, consistency and overall runtime decrease with the number of charge cycles. Battery health of 80% or less is an indicator that a battery is nearing or at the end of its designated life cycle and should be replaced. Health percentage and number of charge cycles are available from MXW control software > Utility tab.

The MXW system’s secondary link slots allow you to prepare alternate microphones to swap in if battery levels get low, to ensure variable battery runtime does not cause audio interruptions. However, the following system adjustments can help get the most runtime out of your batteries.

**External LED Control**

Having LEDs constantly indicate the microphone state can use a significant amount of battery power. Setting transmitters to External LED Control disables the built-in LED except when activated by external commands via the TCPI (third-party control interface). Maximize battery runtime by disabling the LED completely, or by setting the LED to only indicate when the microphone is not in its usual use state.

LED control is set from MXW control software > Preferences tab.

**High Density Mode**

High Density (HD) mode reallocates system resources to create additional channels when needed. In applications where latency, back-channel audio monitoring, and filter control aren’t major considerations, switching to HD mode can also provide up to an hour of additional battery runtime.

Density mode is set from MXW control software > Utility tab > [desired APT] > Edit.

**Use-Case Scenarios**

To estimate runtime on older batteries, find your microphone and the conditions that most closely match your setup. Runtime (hours) was calculated using batteries at 80% health.

<table>
<thead>
<tr>
<th>System Settings</th>
<th>Runtime (hours)</th>
</tr>
</thead>
<tbody>
<tr>
<td>External LED</td>
<td>Density Mode</td>
</tr>
<tr>
<td>External</td>
<td>HD</td>
</tr>
<tr>
<td>External</td>
<td>SD</td>
</tr>
<tr>
<td>Internal</td>
<td>HD</td>
</tr>
<tr>
<td>Internal</td>
<td>SD</td>
</tr>
</tbody>
</table>

**Tip:** If additional runtime is needed, make sure the RF Power is at the lowest setting for the size of the room. RF power is set from MXW control software > Preferences tab.

**Battery Replacement**

Lithium Ion Batteries experience a linear reduction in capacity. Shure recommends establishing a battery replacement schedule customized to the client requirements and replacing batteries when the capacity is no longer acceptable.
**Important:** After installing a new battery, reset the battery health statistics that are stored in the microphone following the steps in Reset the Microphone Battery Statistics in the previous section.

### MXW1, MXW6, MXW8 Battery Replacement

1. Unscrew and open the battery door on the bottom of the transmitter.
2. Remove battery by gently disconnecting the battery connector from the transmitter.
3. Connect the replacement battery's connector to the transmitter.
4. Replace the battery with the label facing out.
5. Close the door and tighten the screw.
6. Dispose of batteries properly. Check with your local vendor for proper disposal of used batteries.

### MXW2 Battery Replacement

1. Unscrew the two screws at the bottom of the transmitter handle.
2. Unscrew and remove the microphone head.
3. Remove the retention clip and gently pull out the battery frame.
4. Unscrew the three screws that fasten the battery door to the frame. Remove the battery door.
5. Replace the old battery with a new one.
6. Replace the battery door and tighten the screws.
7. Gently slide the battery frame back into the transmitter.
8. Replace the retention clip to secure the battery frame in the transmitter.
9. Replace the microphone head. Make sure it is secure.
10. Replace the two screws on the bottom of the transmitter handle.
11. Dispose of batteries properly. Check with your local vendor for proper disposal of used batteries.

---

### Installation

#### Additional Equipment

<table>
<thead>
<tr>
<th>Network Cables</th>
<th>Use shielded Cat5e (or higher) Ethernet cables, limiting cable runs to 100 meters maximum between network devices.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Audio Cables</td>
<td>Reference the hardware kit user guide supplied with the MXW Audio Network Interface to assemble audio cables to the connectors.</td>
</tr>
</tbody>
</table>
### Gigabit DHCP Router (systems with >1 APT)

For systems with more than one APT, a DHCP router is recommended to connect equipment. Ensure that it meets the following requirements:

- Gigabit ports
- Provides Class 0 PoE with at least 6.5W (for powering the MXWAPT)
- Quality of Service (QoS) with 4 queues
- Diffserv (DSCP) QoS, with strict priority
- If the router features Energy Efficient Ethernet (or Green Ethernet), ensure it is disabled from the ports dedicated for the MXW system.
- Recommended: A managed switch to provide detailed information about the operation of each network link: port speed, error counters, bandwidth used, etc.

---

### Connecting MXW Components

MXW components are connected using Ethernet cables and a switch. For a small system with a single access point, the MXW Audio Network Interface functions as the switch. For systems with more than one access point, an additional gigabit switch is required for connecting all the components together.

#### Requirements:

- Use shielded Cat 5e (or higher) Ethernet cables. Limit cable runs to ≤100 m between devices.
- Use Gigabit networking equipment between network audio devices (required for systems with >1 access point).
- Ensure MXW components are on the same firmware version.
- Ensure MXW components and the PC are on the same network and set to the same subnet.

#### Single Group System (1 Access Point)

When the system is limited to a single group (up to eight channels), use the MXW Audio Network Interface four-port switch for connecting MXW components. Connect the computer, access point and up to two chargers to the MXW interface according to the table and diagram:

<table>
<thead>
<tr>
<th>Audio Network Interface Port</th>
<th>To Component</th>
</tr>
</thead>
<tbody>
<tr>
<td>① Port 1 (PoE)</td>
<td>Access Point Transceiver (APT)</td>
</tr>
<tr>
<td>② Port 2</td>
<td>Networked Charging Station (NCS)</td>
</tr>
<tr>
<td>③ Port 3</td>
<td>(Optional) Additional NCS</td>
</tr>
<tr>
<td>④ Port 4*</td>
<td>Computer</td>
</tr>
</tbody>
</table>
*When Port 4 is set to Uplink mode, Shure Discovery Application support is restricted.

Multiple Group System (>1 Access Point)

When an installation requires more than eight channels, additional MXW components can be connected to expand the system. A gigabit router is required to connect all components to the same network. The following are several topologies for multiple group systems.

*Use the Spectrum Scanner to ensure that there is sufficient RF availability for the installation.*

Large Single-Room Installation

1. Power on the DHCP-enabled router.
2. Connect the router to a computer.
3. Connect each APT to a Power over Ethernet (PoE)-enabled port on the router. Use a PoE inserter if the router does not provide it.
4. Connect each ANI to the router.
5. Connect chargers to the ANI ports, or to the router.

Local System Star Setup

To minimize cabling, MXW components can use the Audio Network Interface as a local switch that connects to a shared network.

1. Power on the DHCP-enabled router.
2. Connect the router to a computer.
3. Connect the router to Port 2, 3, or 4 on the Audio Network Interface.
4. Connect the Access Point Transceiver to the Port 1 of the Audio Network Interface.
5. Connect the Network Charging Station(s) to an open port(s) on the Audio Network Interface.
6. Repeat steps 2 - 4 for additional equipment.

Rack Installation

Rackmount the device using the screws and washers supplied in the Hardware Kit. Follow these general best practices when installing equipment in a rack:

- Ambient temperature of the rack should not exceed specified operating temperature range of the device.
- Keep fan inlet and side air vents clear from obstructions and provide adequate space for airflow within the rack.
- When possible, provide 1 RU of empty space between each device.

Securing the Charging Station

This kit provides washers and screws for securing a charging tray to a table or other surface. Use two kits for the NCS8. Please refer to the NCS mounting template for screw hole placement.

**Important:** The top of the screw must extend **exactly** \( \frac{9}{6} \) inches (3.78 mm) above the surface (about 4½ threads).

- Use the screws that best fit the thickness of the table.
- Use a lock washer and flat washer for each screw.
- If necessary, counterbore the screw head or add additional flat washers.
Required Thread Exposure

Use counterbore and washers as necessary depending on thickness of table

Two-Channel Charger Wall Mount

The two-channel charger includes a wall-mount to provide quick microphone access and storage in a classroom or conference room.
NCS2 Secures to a Classroom Wall

Tip: Paint the mount to match the wall for a less obtrusive installation.

Installation

1. Determine the orientation and placement of the mount.

<table>
<thead>
<tr>
<th>Placement</th>
<th>Orientation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wall</td>
<td></td>
</tr>
<tr>
<td>Drawer or tray</td>
<td></td>
</tr>
</tbody>
</table>

2. Leave room around the mount for cabling to the charging station.
3. Attach the mount to the wall. Use one set of screw holes depending on the orientation of the mount.

![Mount Screw Holes]

4. Align the charger on the mount and secure with the screws.

![Tip: Improve cable management using the cable tie holes on the mount.]

**Tip:** Improve cable management using the cable tie holes on the mount.
NCS2 Mount Dimensions

Side View
Top View
Mount the Access Point Transceiver

The directional antennas of the APT send and receive the RF signal in a cardioid pattern with the greatest sensitivity toward the face of the device. Always aim this side toward the microphone coverage area.

Select a Location

The access point is typically mounted to a ceiling or wall near the microphone coverage area. For best results, perform a Spectrum Scan at potential locations to find the optimal placement (see Wireless Management section for more details).

Use the following best-practices when selecting a location for the device:

- Direct the face of the access point toward the intended coverage area.
- Position the access point so there is nothing obstructing a line of sight to the microphones.
- Keep device away from large metal objects.
• Keep at least eight feet between access points.
• Mount with its reset button accessible, as it may be useful for troubleshooting.

Important: Always perform a "walk around" test to verify coverage before using a wireless system during a speech or performance. Experiment with antenna placement to find the optimum location. If necessary, mark "trouble spots" and ask presenters or performers to avoid those areas.

Mounting Plate as Template

Securing to a Wall or Ceiling

Required Equipment

- Two #8 screws at appropriate length*  

*Screw Length = Surface thickness + thread engagement (4.75 mm max.) + thickness of flat washer + the thickness of the split lock washer

General Installation Steps

1. Use the mounting plate as a template and mark the location for the holes.
2. Drill the holes into the mounting surface.
3. Secure mounting plate to the surface.

   CAUTION: Do not over-tighten screws, as this could cause permanent damage to the charging station

4. Connect of the Ethernet cable to the MXWAPT using the cable route path.
5. Position the MXWAPT over the keyway slots of the mounting plate and slide it down into the locked position.
External Cover for Painting
The Access Point is supplied with an external cover that can be painted to match the decor of the installation. After it has been painted and dried, it snaps onto the front plate of the device.

Power the Hardware

① Audio Network Interface (ANI)
Connect the IEC power cable from the back panel to an AC power source. Turn on the power switch.

② Access Point Transceiver (APT)
Connect a shielded Cat5e cable from the MXWAPT to network Port 1 of the MXWANI. If using an external gigabit switch, ensure Class 0 PoE provides at least 6.5W of power to the APT. There is no power switch.
③ Networked Charging Station (NCS)

Connect the PS60 external power supply from the charger to an AC power source. Turn on the power switch.

Fully Charge the Transmitters

Whenever possible, charge to full the MXW transmitters before an event. Transmitters can be charged in any networked charging station, even if it is associated to another Group or on a separate network.

Battery Charge Times

Approximate Charge Times

<table>
<thead>
<tr>
<th>Charger Type</th>
<th>Time to Full Charge* (hr:min)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Networked Charging Station (NCS)</td>
<td>2:00</td>
</tr>

<td>Powered On = 3:30</td>
</tr>
<tr>
<td></td>
<td>Powered Off = 2:30</td>
</tr>
</tbody>
</table>

*Calculated with a new battery. Runtimes vary depending on battery health.

Open the MXW Control Software

Access the MXW control software from any computer on the MXW network. The software is hosted from a webserver embedded in the MXW devices, and operates using Adobe® Flash®.
There are two different control interfaces for MXW devices:

- **MXW system (hosted in APT):** For comprehensive control of key setup, monitoring and management functions for the MXW system. Accessed from the Access Point Transceiver (APT).
- **Audio Inputs and Outputs (hosted in ANI):** For sending audio channels on and off the Dante network. Accessed from the Audio Network Interface (ANI).

1. **Get the Shure Web Device Discovery application.**
   
   Get the Shure Web Device Discovery Application to see devices on the network and open the control interface. Download the software from www.shure.com/software (includes Bonjour device discovery tool).

2. **Connect the computer to the MXW network.**
   
   The computer accesses the control software from an embedded web server on the device. All networked devices must be connected to the same network (set to the same subnet).

3. **Turn off WiFi (recommended)**
   
   For best results, turn off the PC's WiFi to force the wired network interface.

4. **Open the Shure Web Device Discovery application.**
   
   Open the application to view Shure devices on the network that use an embedded server for control software, such as the APT. You can use the Identify button to flash a device’s LEDs for easy identification.

5. **Open the MXW Control Software**
   
   Double-click on any APT to open the MXW System control software. The application can be set to open by IP address or DNS name (selectable from the Preferences drop-down).

6. **Enter Default Password**
   
   Enter the default password ‘admin’ to access the control software.

7. **Bookmark the Webpage (recommended)**
   
   Bookmark the IP address of the device when it is set to a Static IP address. Bookmark the device’s DNS name when the IP mode is set to Automatic (DHCP).

**Operating System Requirements**

To operate the control software, the computer must meet the following requirements:

- Windows: Windows XP, Windows Vista and Windows 7
- Apple: Mac OS X 10.6 and higher (Intel Core 2 Duo processor and later)
- Latest version of AdobeFlash Player

**System Set Up**

**Group Devices to Form Audio Channels**

Use the group configuration to form the audio channel between the microphone, the access point (APT), charger and audio output device. The audio channel establishes the audio routing, RF coordination, and data control for a set of devices. Groups are comprised of networked devices (set to the same subnet). A component can belong to one group at a time.
Start with the APT and select the corresponding devices:

- Chargers: for linking microphones
- Audio outputs: for routing audio to analog outputs

Once the group formed, microphones can be linked to channels using the charging station.

**Select Devices for the Group**

Use the MXW control software to view devices on the network and assign them to a group.

**Tip:** Use the ID button to identify a device. This flashes the component LEDs for easy identification.
1. Go to the Configuration Tab

Assign the devices to groups from the Configuration tab of the MXW control software.

2. Select the Access Point Transceiver (APT) for Group 1

Select an APT to determine group channel count (2, 4 or 8).

*Group 1 automatically uses the APT opened from the Web Discovery application. Other networked (and open) APTs are available for additional groups.*

3. Select the Network Charging Station(s)

Select one or two Network Charging Station (NCS) to the access point. An additional charger can be added to the group:

- When using multiple smaller chargers to fill the channel count of the group. For example, two 4-channel chargers for an 8-channel group.
- When using gooseneck microphones. Gooseneck mics cover the front and back slots of a charger, halving the number of slots available. For example, two eight-channel chargers are required to fill an eight-channel access point with gooseneck microphones.

4. Select the Audio Output Device(s)

Select one or two audio output devices (MXWANI or SCM820) to automatically route the digital audio channels from the access point. Select from the following devices:

- Audio Network Interface (MXWANI) four- or eight-channel variation.
- Shure SCM820 IntelliMix® Mixer. Dante-enabled SCM820s can be selected as the audio output for the Group. This automatically routes the SCM820’s aux input to the microphones for personal monitoring (SCM820 aux left channel to MXW channels 1 - 4; aux right channel to MXW channels 5 - 8).

*Note: Component group and microphone link data are persistently stored in each device. If the MXW system is shut off and then restarted without a computer, the devices will remain associated to the access point.*
Device Availability

When setting up a group or managing devices, it is important to understand the difference between open and associated devices.

<table>
<thead>
<tr>
<th>Device Availability</th>
<th>A device that is not associated to a group is considered 'open.' Open devices are available for association by selecting the drop-down window in a Group row. The device will show Open in the Group column of the Utility page.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Associated Device</td>
<td>A device is considered 'associated' once it has been selected in a group row. Each device can only belong to one group at a time (and therefore one Configuration). Once a device has been associated to a group, it is managed on the Configuration tab can be viewed in detail on the Utility tab. The device will show its group number in the Group column of the Utility page.</td>
</tr>
</tbody>
</table>

A device can be unassociated by selecting 'none' in the group row drop-down to clear it from the group. The device is then open and available for association to another group.

*Tip: Performing a factory reset will default the device to open.*

Device Availability

Automatic Group Setup

An MXW Group can be associated without use of the control software when a network is comprised of only one Access Point Transceiver (APT), one Networked Charging Station (NCS) and one Audio Network Interface (ANI). For best results, perform a factory default on the devices to clear any previous Group associations.

1. Connect one APT, one NCS and one ANI to the network. The network must only contain one of each device.
2. Perform a factory reset on the devices (see the Factory Default section).
3. On the front panel of the ANI, press both input level selection buttons at the same time and hold for five seconds. The Channel Select LEDs will illuminate green and the audio meter will flash to indicate that the association is successful.

Channel Routing between Devices

Channels are routed when charging stations and output devices are selected to fill the APT group (2-, 4-, or 8-channels). Once the devices are selected for the group, the channels are mapped between the charging slots, audio outputs and the wireless receiver.

Group selections are made from the Configuration tab of the control interface.

Group Selections Determine Routing

Each group has two selections available for charging stations and audio output devices. The selections determine the channel routing in the group.

Charging Station Examples

8-Channel Group

Boundary, Handheld or Bodpack Microphones

Only one 8-channel charger is needed to fill the group with these types of microphones.
Gooseneck Microphones

This setup is used to fill an 8-channel group with gooseneck microphones. Channels are rerouted when an additional charger is added to the group. (The gooseneck base is larger and covers two charger slots.)

Mixture of Gooseneck and Boundary Microphones

When 4-channel and 8-channel chargers are selected, group channels five through eight are automatically routed to the back row of the 8-channel charger.

4-Channel Group

Gooseneck Microphones

This setup is used to fill a 4-channel group with gooseneck microphones.

2-Channel Group

2-Channel Charger

The 2-channel charger supports boundary, handheld, and bodpack microphones.
Audio Output Examples

8-Channel Group

8-Channel SCM820 Digital Automatic Mixer

Channels are routed to the eight outputs of the mixer.

Two 4-Channel Audio Network Interfaces

Channels are routed across both interfaces to fill the group.

4-Channel Group

8-Channel Audio Network Interface

Channels are routed to the first four outputs of the interface.

Link Microphones to Group Channels

Use the Networked Charging Station (NCS) to Link microphones to Access Point channels. Slots in the charger are mapped to the APT according to the Group setup from the Configuration tab. Once the Link procedure is complete, audio will route to the corresponding channel in the Group.

Linking will map any microphone placed in the charging station to the APT channels. This replaces any prior microphone Link for that channel. If a slot is empty during the Link procedure, there will be no impact on that channel.
1. Arrange microphones in the charger.

Microphones are Linked to access point channels according to the arrangement in the charger.

*Note: 2-channel chargers do not support gooseneck microphones.*

<table>
<thead>
<tr>
<th>Connecting the Microphone to the Charger Slot</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Diagram" /></td>
</tr>
</tbody>
</table>

2. Link the microphones to channels.

Use the control software or the charging station to Link the microphones to APT channels. If desired, this feature can be disabled on the charging station so that Linking can only be performed from the control software:

- **Control Software:** From the Configuration page, press the Link button for each charger in the Group.
- **Charging Station:** Press and hold the Link button for 6 seconds. The LEDs flash during the process and turn solid green once the Link is successful.

3. Remove Mics and Test the Audio

Test the audio for each microphone and adjust mic gain if necessary from the Monitor tab of the control software. The gain should be set at a level where the audio is registering (green/yellow) on the signal indicator but not clipping (red).
Preparing a Backup Microphone

Prepare an alternate microphone for each channel for more reliable and flexible events. Two MXW microphone transmitters can be linked to the same channel, providing the option of either microphone for use.

Link a mic to the secondary slot to anticipate needs that may arise during events:

Microphone Preference

*Give presenters a choice between two different microphone types, such as handheld or bodypack microphones.*
Charged Backup Microphones

Prepare for long events by linking fully-charged microphones as backups

Shared Resources

Easily add a temporary microphone without unlinking the most commonly used microphones.

One Active Mic per Channel

Only one microphone will operate on the channel at a time, blocking the second microphone from interfering with the RF and audio performance. The backup microphone briefly flashes the LED to indicate the channel is occupied, and automatically turns off to conserve the battery. To use the second microphone, simply turn off the first microphone.

Procedure

Link a single microphone:

1. Place the secondary microphone into the same charging slot that was used for the primary microphone.
2. Open the MXW control software and go to the Monitor tab.
3. Select Secondary in that channel's link slot.
4. Select the Link button on the channel strip to link that microphone. The charger LEDs will flash when the procedure is complete.

Link multiple microphones:

1. Place the secondary microphones into the same charging slots that were used for the primary microphones.
2. Open the MXW control software and go to the Configuration tab.
3. Find the desired charger in the group row. Use the ID button to make sure the right charger is selected.
4. Select the Link button in the group row.
5. In the popup window, select All Secondary for the link slot.

Exchanging or Removing a Component

Exchanging a Transmitter
The same Link procedure is done to exchange a transmitter in a group. Place the new transmitter in the charger slot that corresponds to the desired channel and perform the Link procedure. This will map the new transmitter to that channel, and remove any Link from the old transmitter.

If an NCS channel slot is empty during the Link procedure, the channel will remain unaffected.

Important: Use caution when replacing microphones, as the Link procedure applies for all microphones in the charger. The Link will immediately override any existing microphone's audio and RF connection to the system.

Remove a Device from a Group
To remove a device from a group, open the MXW Control Software and go to the Configuration tab. In the group row, select the device drop-down window that contains the desired device. Select 'none' to clear the device association.

Note: A factory reset will also remove the any association or Link status.

Link a Microphone Over the Network
To improve device management from a central help desk or technician station, a microphone can be linked to any group on the network using a remote charging station. Using a control system, send the command strings* to replace a microphone for a specific channel. Group settings are not affected by this procedure.

1. Connect a spare charger to the network.
2. Place the microphone in a charging slot.
3. Modify the following command string according to the setup:

   \[
   \text{SET PRI x REMOTE\_LINK y \{zzz.zzz.zzz.zzz\}}
   \]

   ① PRI (primary) or SEC (secondary) channel link
   ② Charging slot number used for new microphone
   ③ Channel targeted for this procedure
   ④ IP address of the APT (device that stores the group settings)

4. Send the command to the charger.
5. Verify the command response:
A comprehensive list of MXW command strings are available on the Shure website: www.shure.com, search “command strings”.

Large Installations
Shure SystemOn Software For Managing Large Systems
Shure SystemOn Audio Asset Management Software provides a central platform for managing mission critical, large-scale deployments of Shure audio hardware across corporate and higher education networks. SystemOn goes beyond the functionality of the MXW control software, working across subnets and APT groups to provide IT administrators and AV technicians the ability to proactively monitor and control Shure hardware devices remotely using a laptop, smartphone or tablet.

High Density Mode
High Density (HD) mode creates additional channels for large meetings and crowded RF environments. HD mode doubles the number of channels available in standard mode, with minor changes to some system features. You can set the density mode for each APT individually to get the right blend of channel count and audio performance.

Density Mode Comparison

<table>
<thead>
<tr>
<th>Feature</th>
<th>Standard Density</th>

*For Americas region. See Maximum Channel Count table for availability worldwide.

Setting the Density Mode
Set the mode for each APT from the device properties:

1. Go to MXW control software > Utility tab > [Find the desired APT] > Edit
2. Choose a density mode:
   - Standard (default)
   - High
3. Select Add updates to exit the device properties.
4. Select Apply All from the Utility page to push to your devices.

Configurations: Managing Multiple Groups
Configurations allow multiple Groups to share the same preferences, global controls and log-ons. When an additional Group is added to the Configuration tab, the new components will take on the preferences and global actions of that Configuration. For example, all microphones Linked to Groups in that Configuration will mute when the global Mute All button is pressed.
For specialized applications, such as multiple room installation, separate Configurations can be created to independently control component Groups.

**Configuration Master**

When using a Configuration to manage multiple groups, the system dynamically assigns a particular Access Point as the “Configuration Master”. All Access Points in that Configuration use the Configuration Master Access Point as an entry point to the same control interface. This enables the coordination of preferences and the synchronization of system operations across multiple devices.

When the Configuration Master Access Point is unplugged (or PoE is powered off), a new master is quickly re-established to maintain control of the Configuration. If the Configuration Master is manually removed by deselecting the Access Point from the Group on the Configuration tab, there will be a pop-up warning “Are You Sure?”. If Yes is selected, the browser will close and a new Configuration Master is automatically selected. Use the Shure Discovery Application to re-open the control interface from any remaining MXW Access Point.

**Creating Separate Configurations**

For installations that spread across multiple rooms, a different set of preferences and global controls may be required for a given space. Do this by setting up a separate Configuration:

1. Open the Shure Web Device Discovery Application.
2. Select the Access Point that will be used for the new Configuration and open its control software. The APT must be open (not already assigned to a group) in order to start a new configuration.
3. Go to the Configuration tab.
4. Select that Access Point from the drop down list in Row 1. Use the ID button to ensure the correct Access Point is selected.
5. Select the charging station(s) and output device(s) to complete the Group.
6. Repeat 4-5 for up to 10 Groups in the Configuration.
7. Enable the Lock Configuration to improve network performance.
8. Customize the Configuration as desired from the Preferences tab.

*Note: Ensure that all APTs are connected to the same network and set to the same subnet, even if they are assigned to a separate Configuration. This ensures the best system performance, highest channel count, and tightest digital audio clocking for the installation.*

**Locking the Configuration**

Use the Lock Configuration feature to improve network performance and system stability. It is best practice to lock a configuration after setup to greatly reduce network traffic from MXW equipment. When systems exceed 15 APTs on the same network, configuration locking is required for stable performance.

*When locked, groups in that configuration are not editable.*
Lock the Configuration for Best System Performance

After setting up all your MXW groups, lock the configuration to minimize network traffic.

Wireless Management

Overview of Channel Coordination

The MXW system operates using time division multiple access (TDMA) to carry MXW channels (audio and control data) within defined RF spectrum. Channels are automatically assigned to the time-slots by the access point, which manages the spectrum and seamlessly changes slots if interference is detected. The MXW system makes this adjustment automatically and without audio artifacts.

Maximum Channel Count

The following table shows the maximum MXW channel count available in each region. Use the spectrum scanner to view how many of these channels are available to you at your installation.

**Scanning Available RF Spectrum**

The MXW Wireless components operate in unlicensed spectrum that is shared with other wireless devices operating in the same area, such as cordless phones, walkie-talkies and intercoms. The MXW control software features a scanning tool that surveys the RF spectrum for these devices. It calculates the percentage of Radio Frequency Interference (RFI) in the area and provides recommended channel count ranges. Estimated channel counts are displayed for both standard and high channel count modes.

During a scan, any microphones linked to that Access Point are turned off in order to survey the area for interference from other devices. The scan calculates the current spectrum and the minimum spectrum available, which provides the greatest level of safety in determining channel count availability in a space. The Minimum Spectrum Available data will persist until a new scan is performed or the data is cleared.
Displays the percentage of available spectrum

Radio Frequency Interference (RFI)

The scanner analyzes the spectrum and divides the data into three categories:

No/Low (Green)

Clean RF available for MXW system.

Moderate (Yellow)

Some moderate interference is detected, still usable by the MXW system.

High (Red)

Busy RF occupied by other devices.

Estimated Mic Channel Count

The scanner provides two estimate levels for MXW microphones:

Conservative (More Robust)

Reference this channel estimate for maximum channel stability. It includes extra usable spectrum for optimal interference avoidance, allowing multiple microphones to find available frequencies simultaneously.

Aggressive (More Channels).

Reference this estimate to get the most channels on air. It reserves only the minimum required extra spectrum for interference avoidance. Be sure to occasionally monitor the spectrum and make channel adjustments if the RFI increases.

Performing a Scan

Follow these steps to perform RF scan.

Tip: Perform the scan during typical hours of operation to best capture the typical interference in an environment.

1. Ensure all typically used devices are turned on, including any MXW equipment already in use.
2. Place the new MXW Access Point near the location it will be mounted.
3. Ensure the APT is on the same network and set to the same subnet as the other MXW equipment.
4. Open MXW control software to the Monitor tab. Make sure the new Access Point is selected from the drop down on the top left corner of the Monitor tab.
5. Select the Spectrum Scanner to open the window.
6. Select the Start Scan button at the top of the window. If any microphones are Linked to that Access Point, they will be turned off during the scan.
7. For best results, allow the scan to run for up to 24 hours to get a full snapshot of the spectrum throughout the day. Press End Scan to end the scan mode.

PHS Detection

The APT scanner may discover interference from devices that have priority in the JDECT spectrum. When personal handy-phone systems (PHS) are detected, the MXW system will automatically reduce operation to 40% of typical spectrum use.

The APT automatically scans for PHS upon power up and when the Spectrum Scanner is manually launched from the Monitor tab. The Spectrum Scanner includes the PHS limits when calculating the maximum channel estimates to provide the safest estimates.
Excluding PHS Bands

To operate in the JDECT spectrum without worrying about PHS interruption, set the MXW access point (APT) to exclude PHS channels. This reduces the number of MXW channels available, but ensures that microphones will never be overridden in the event of PHS detection.

1. Go to **MXW control software > Utility tab**.
2. Select the APT and open the device properties.
3. Select **PHS Exclusion**.
4. Select **Add Updates** to close the window.
5. Start the update by selecting **Apply All** from the Utility page.

Identifying PHS Detection Errors

When operating in the JDECT band without PHS Exclusion, transmissions from adjacent MXW systems can trigger a PHS detection.

JDECT regulations require an automatic cutoff in devices transmitting RF signals on the channels used by the PHS mobile phone network. When an MXW APT detects a signal above the -82dBm RSSI threshold, it stops transmitting and a warning displays on the Monitor tab of the MXW web application.

Some applications may be outside of the range of the PHS mobile network and can benefit from use of the additional channels. To overcome PHS detection from a nearby MXW system, run a spectrum scan to find new, non-restricted frequencies.

Resolving PHS Detection Errors

Before you begin, use the Web Device Discovery application to confirm all APTs are online and connected to the same subnet. Next, reduce wireless RF overlap between APTs by lowering the RF Power to Low from the Preferences tab of the MXW web app. You can change power settings back after resolving the error.
**Caution:** Audio is temporarily interrupted during spectrum scan. Do not initiate a scan during a live meeting.

### Running Spectrum Scans

1. Dock all microphones in chargers to decrease MXW affect on the RF spectrum.
2. Open the Web Discover application and view all APTs on the network.
3. Open each APT web application and go to the monitor tab.
4. Start a scan on all APTs and let them run at the same time for at least 15 seconds. This analyzes the spectrum and selects the best channel to operate on.
5. Stop the scan, and check for detections. If you do not show any PHS error, the system is ready to go.
6. If PHS error persists, repeat the scan up to 3 times.
7. If PHS detection persists through 3 or more spectrum scans, the signal is most likely coming from the PHS network. Switch your systems to PHS Exclusion mode to operate reliably on fewer channels.

**Tip:** Resolved detection notifications should not reoccur until a new spectrum scan is initiated, either manually or by rebooting/power cycling the system.

### Setting RF Power

The RF radius of a configuration can be limited to allow another MXW system to re-use the frequency time-slots. It is best practice to use the lowest setting that supports the installation. Perform a walk-around test with the transmitters to ensure that the coverage setting is sufficient.

The RF Power is set from the Preferences tab of the control software. The setting applies to each access point in the Configuration. Reference the following table for setting the RF Power.

#### RF Power Levels

</tr>
</tbody>
</table>
Optimal Placement of the Access Point

*Place the Access Point in the center of the installation for best coverage*

Using Multiple 2- or 4-Channel Access Points

The MXW access point uses two sets of antennas to cover the operating spectrum. Each antenna set covers half of the timeslots used for MXW channels. Eight-channel units use both antenna sets simultaneously; two- and four-channel units use one set at a time, operating on half of the available timeslots. The full spectrum can be covered if they are configured to alternating antenna sets.

When an installation uses multiple two- or four-channel access points (APT2 or APT4), configure the access point settings to maximize channel count. This is particularly important for APTs that are mounted in the same or neighboring rooms.
Requirements
The MXW system must be operating on a minimum firmware version of 2.0.0.

Set Up

1. Open the MXW control software using the Shure Web Device Discovery application.
2. Go to the Utility page.
3. Open the Device Properties window for the two- or four-channel access point (MXWAPT2 or MXWAPT4).

4. Note that the APT is set to Mode A by default (Device View > RF Mode Settings > RF Coordination Mode). Close out of the window.
5. Open the Device Properties for the adjacent APT2 or APT4.
6. Set the unit to Mode B (Device Properties > RF Mode Settings > RF Coordination Mode).
7. Select Add Updates to save the setting and close the window.
8. Make sure any additional APTs are set to alternating RF Coordination modes.
9. Select Apply All button on the Utility page to update all device settings.

Networking

Networking Best Practices

Use the following best practices when setting up a network to ensure reliable communication:

- Always use a "star" network topology by connecting each component directly to the switch or router.
- Connect networked MXW gear to the same network and set to the same subnet. This ensures best system performance and maximum microphone count.
- Use only 1 DHCP server per network. Disable DHCP addressing on additional servers.
- Power on the switch and DHCP server prior to MXW equipment.
- To expand the network, use multiple Ethernet switches in a star topology.
- Connect each device directly to the port of an Ethernet switch. Avoid "daisy-chaining" Ethernet port connections between devices for larger networks.
- Do not loop network connections.
- All devices must be at the same firmware revision level.
Configuring IP Settings

Go to the Utility tab of the control software to manage the IP configurations of each network interface. By default, they are set to Automatic (DHCP) mode. DHCP mode enables the devices to accept IP settings from a DHCP server, or automatically fall back to Link-Local settings when no DHCP is available. To manually set the IP address of an interface, select Manual (Static).

The MXW control software coordinates IP updates across the entire system of devices. To configure the IP properties, follow these steps:

1. Open the MXW control software from the Shure Web Device Discovery app.
2. Go to the Utility tab.
3. Adjust IP settings for each device by selecting the Device Properties.
4. After adjustments have been made, select Add Updates. This saves the settings to the changes queue.
5. Repeat for any additional components.
6. To send updates to the devices, select Apply All to the Pending Changes field of the Utility page.
7. The computer may temporarily lose connection to the control software during the updates process. When the device has been reconfigured, reopen the software using the Shure Device Discovery application.

Go to *Utility > Device Properties* to manage the interfaces of each MXW device on the network.

**Network Audio and Shure Control Data**

MXW devices transport two types of data over the network: Shure Control and Network Audio.

**Shure Control**

The Shure Control carries data for the control software operation, firmware updates and 3rd party control systems (AMX, Crestron). This data is transported to all MXW components connected to the network.

**Network Audio**

This network carries both the Dante digital audio and the control data for Dante Controller. This data is transmitted between the APT, the output device and the computer. The network audio requires a wired, gigabit Ethernet connection to operate.

The two data types are configured differently for each MXW device. Go to *Utility > Device Properties* to view and edit the IP settings for MXW devices.

**Network Settings for Each MXW Device**

<table>
<thead>
<tr>
<th>MXW Device</th>
<th>Network Implementation for Audio and Control</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Point Transceiver (APT)</td>
<td>Separate IP settings</td>
</tr>
<tr>
<td>Audio Network Interface (ANI)</td>
<td>Shared IP settings</td>
</tr>
<tr>
<td>Networked Charging Station (NCS)</td>
<td>Shure Control settings only. (The NCS does not transport network audio.)</td>
</tr>
</tbody>
</table>

**Manually Assigning Static IP Address**

To manually assign IP addresses to the MXW system, follow these steps:

1. Open the Utility tab.
2. Select Edit to open the device properties window.
3. Select the Manual (Static) IP Mode.
4. Enter the IP settings
5. Select the Add Updates button to queue the saved settings.
6. Repeat for all additional components
7. Finalize all updates by pressing the Apply All button from the Utility tab. All devices with pending changes will update.

*Note: The control software may close if settings have been updated for the APT.*

8. Change the computer's IP address to match the subnet of the MXW equipment.
9. Reopen the MXW control interface using the Shure Device Discovery application.

**Advanced Setup**

For more information on configuring advanced MXW networks, reference the Microflex Wireless Networking whitepaper located at [www.shure.com](http://www.shure.com).

**Isolating Audio and Control Networks**

When connecting to corporate or public networks, the MXW system can be configured to isolate audio network from the control network. This protects the audio from distributing to the entire network and significantly decreases network traffic.

The MXW Audio Network Interface (ANI) can be set to Uplink mode to dedicate one of its network ports as a control-only connection. Uplink mode blocks multicast traffic from Port 4 of the ANI, restricting network audio and Shure Discovery data.

Because the device will not show up in the Shure Device Discovery application, the IP address of the control software must be recorded to access the server.

1. Record the IP address of the ANI.
2. Connect Port 4 of the ANI to the network.
3. Use the Shure Web Device Discovery application to open the control software of the ANI.
4. Go to the Preferences tab.
5. Under the Network panel, change Port 4 Mode to Uplink.

**Managing Large Systems on a Single Network**

To manage large systems on a single network, lock the configuration after setting it up. This improves network performance and stability, allowing a greater number of MXW systems to operate on the same network. This is especially important if there are more than 15 total MXW APTs on a subnet.

**Tip:** Use an isolated network to set up or modify a configuration for best system performance.

1. Connect the MXW equipment and a computer to an isolated network.
2. Open the MXW browser interface to the Configuration tab.
3. Create the configuration by associating each APT to the audio output device(s) and network charging station(s).
4. Select the Lock Configuration box.
5. Connect the components to the intended network.
6. Repeat for additional configurations.

**Operating the Control Software over Wi-Fi**

When operating the MXW control software over Wi-Fi, it's important to set up the wireless router properly for best performance. The MXW System employs several standard-based protocols that rely on multicast. Wi-Fi treats broadcast and multicast packets differently than general packets for backward compatibility reasons. In some cases, the Wi-Fi router will limit the multicast packet transmission rate to a value that is too slow for GUI to properly operate.
Wi-Fi routers typically support 802.11b, 802.11a/g, and/or 802.11n standards. By default, many Wi-Fi routers are configured to allow older 802.11b devices to operate over the network. In this configuration, these routers will automatically limit the multicast data rates (or sometimes referred to as ‘basic rate’, or ‘management rate’) to 1-2Mbps.

*Note:* A Wi-Fi connection can only be used for the control software. Network audio cannot be transmitted over Wi-Fi.

*Tip:* For larger wireless microphone configurations, it's recommended to increase the multicast transmission rate to provide adequate bandwidth to the MXW control software.

**Important:** For best performance, use a Wi-Fi router that does not limit the multicast rate to 1-2 Mbps.

Shure recommends the following Wi-Fi router brands:

- Cisco
- Linksys
- Apple

**Dedicate a Device for Master Clock**

Dante uses the IEEE 1588 Precision Time Protocol (PTP) to automatically select one device as the master clock for all Dante devices on the network. PTP ensures that all devices are similarly clocked, which is critical for both audio delivery over the network and time-synced RF transmission over the wireless link. The master clock in an MXW System is the first MXW access point that connects to the network. If several connect simultaneously, the access point with the lowest MAC address will be selected. Additional MXW components on the same network synchronize (slave) to this access point clock master.

When a master device shuts down or goes offline, the system will automatically begin selecting another master. During this selection time (up to 30 seconds), the entire system will **NOT** pass audio.

If the network setup or building management requires that devices are periodically shut down, you can manually select an access point as the Preferred Master device from Dante Controller software. This allows the installer to set up the system to ensure that the master access point never shuts down during events.

**Setting Latency**

Latency is the amount of time for a signal to travel across the system to the outputs of a device. To account for variances in latency time between devices and channels, Dante has a predetermined selection of latency settings. When the same setting is selected, it ensures that all Dante devices on the network are in sync.

The latency setting for Dante devices should be set according to the number of switches in the network. The MXW Audio Network Interface and Access Point both include an internal switch chip, which counts as a switch. For example, one network interface connected to an access point equals two switches.

Use Audinate’s Dante Controller software to change the latency setting.

**Latency Recommendations**

<table>

*These ports must be open on the PC or control system to access the device through a firewall.

†These protocols require multicast. Ensure multicast has been correctly configured for your network.

### Packet Bridge

Packet bridge enables an external controller to obtain IP information from the control interface of a Shure device. To access the packet bridge, an external controller must send a query packet over **unicast UDP** to **port 2203** on the Dante interface of the Shure device.

1. **Send a UDP packet with a minimum 1-byte payload.**

   *Note: The maximum accepted payload is 140 bytes. Any content is allowed.*

2. The Shure device will send a response packet over **unicast UDP** to the controller, using a destination UDP port identical to the source port of the query packet. The payload of the response packet follows this format:

<table>
<thead>
<tr>
<th>Bytes</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-3</td>
<td>IP address, as 32-bit unsigned integer in network order</td>
</tr>
<tr>
<td>4-7</td>
<td>Subnet mask, as 32-bit unsigned integer in network order</td>
</tr>
<tr>
<td>8-13</td>
<td>MAC address, as an array of 6 bytes</td>
</tr>
</tbody>
</table>

*Note: The Shure device should respond in less than one second on a typical network. If there is no response, try sending the query again after verifying the destination IP address and port number.*

**UDP**: User Datagram Protocol
Software

Shure Web Device Discovery Application

The Shure Web Device Discovery application is used to access the graphical user interface (GUI) of a Shure device. The GUI opens in a web browser to provide comprehensive device management. Any computer networked to the device can access the GUI with this application.

To use the application,

- Double-click on a device or press the Open button to open a GUI.
- Right-click on a device to copy its IP address or DNS name.
- Select Network Settings to monitor the computer's network interface details.

1. **Refresh**: Updates the list of devices.
2. **Network Settings**: Displays the network interface details of the computer
3. **Select All**: Selects all devices in the list.
4. **Open**: Opens the GUI of a selected device in a browser window.
5. **Identify**: Prompts the selected device to flash its LEDs for identification.
6. **Shure Website**: Links to the Shure website.
7. **Help**: Access the application help file or link to www.shure.com to view for updated versions of the application.
8. **Preferences**: Determines whether the application launches the DNS name or the IP address of the selected device.
9. **Device List**: List of Shure devices with an embedded GUI on the same network.
   1. **Model**: The device's model name.
   2. **Name**: Corresponds to the Device Name defined in the GUI.
   3. **DNS Name**: The domain name that is mapped to the device's IP address. The DNS name will not change, even if the IP address changes (making it useful as a hyperlink or bookmark in your browser).
   4. **IP Address**: The device's assigned IP address. IP address settings can be changed in the device's GUI.
   5. **Network Audio** Indicates which Network Audio protocols the device supports. See the product User Guide for information on how to configure an audio network.
   6. **Web UI**:
      
      - Yes = The device has a graphical user interface that opens in a web browser.
      - No = The device does not have a user interface.

7. **Same Subnet**:

       - Yes = The device and computer are set to the same subnet.
       - No = The device and computer are set to different subnets.

       Unknown = The firmware of the device does not support this feature. Update the device firmware to view the additional connection information with this app.
The MXW control software allows comprehensive system control and monitoring from a computer. It is hosted from an embedded server in the MXW Access Point, and is accessible when properly networked to a computer. All hardware functions can be adjusted using this software interface.

**Log On Page**

1. **User**
   
   There are three security levels to the Control Software: Admin, Tech and Guest. By default, only Admin is enabled. Log on and go to the Preferences tab to manage the User log on.
   
   **Admin (default):** Full editing rights. The Admin can enable or disable a Tech-level logon.
   
   **Tech:** Partial editing rights, limited to microphone management on the Monitor tab.
   
   **Guest:** Monitoring only.

2. **Password**
   
   Enter the password to log on as an Admin or Tech. The default password is 'admin' for the Admin user. To change the password, log on as an Admin and go to the Preferences tab.

3. **Keep Me Logged On Button**
   
   When selected, this allows the user to bypass the Log On page when reopening the control software.

4. **Language Selection**
   
   Selects the language for the GUI. This setting will be saved to the computer.

5. **Log On Button**
   
   Press the button to log onto the control software.

*Note: Default password is 'admin'*
Control Bar

① Tabs
- Monitor: Adjust microphone status and view RF spectrum availability.
- Configuration: Form groups of components
- Utility: View details and manage IP settings of each MXW device on the network
- Preferences: Assign microphone and system behavior

② Security Level
Displays the access level of the user: Administrator, Technician, or Guest.

③ Log Off
Logs the user out of the software.

④ Shure Link

⑤ Language Selection
Selects the language for the control software interface. This setting will be saved to the computer.
Monitor Tab

1. **Access Point Selection**
   Determines which Access Point displays on the tab.

2. **Density Mode Selection**
   Displays the density mode as selected in the APT device properties.

3. **Spectrum Scanner**
   Opens the Spectrum Scanner window. See Scanning Available RF Spectrum section for more details.

4. **Global Mic Control**
   Controls the status of all microphones in the configuration (all groups made from the Configuration tab).

5. **Channel Name**
   Channel names are customizable and apply to any linked microphone. The name persists even if a different microphone is linked.

6. **Microphone Link Slot**
Selects the microphone that displays on the channel strip.

Note: One microphone is on-air per channel, though an alternate microphone can be prepared in the secondary link slot.

Identify Button

Commands the microphone to flash its LEDs to easily identify which device corresponds to the channel.

Microphone Status and Control

View or change the microphone state:

- **Active**: On and passing audio to the network.
- **Mute**: On but the audio is muted.
- **External**: On and passing audio to an external controller that controls the mute/active behavior.
- **Standby**: On but in a 'sleep' state with audio muted. Standby conserves battery charge and enables a change to the microphone's status from the control software.
- **Charging**: Battery is charging.
- **Inactive**: Off or out-of-range. A microphone in this state cannot be remotely controlled by the software.
- **Power Off**: Turn off the microphone.

Battery Status

- **In the charger**: Displays the remaining time until the microphone battery is fully charged
- **Out of the charger**: Displays the remaining battery runtime of the microphone.

Audio Input Meter

Indicates the average input signal level.

<table>
<thead>
<tr>
<th>Color</th>
<th>Audio Signal Level (dBFS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red</td>
<td>0 to -9</td>
<td>Overload</td>
</tr>
<tr>
<td>Yellow</td>
<td>-9 to -18</td>
<td>Normal peaks</td>
</tr>
<tr>
<td>Green</td>
<td>-18 to -60</td>
<td>Signal Present</td>
</tr>
</tbody>
</table>

RF Signal Strength

Indicates the signal strength of the microphone. When the bars are grey, the microphone is out of range.

Mic Gain

Adjusts microphone gain from -25 dB to +15 dB gain in 1 dB steps.

High-Pass Filter

Engages a 12 dB-per-octave filter below 150 Hz for attenuating undesired low frequencies, sometimes caused by table vibrations or air-conditioning rumble. Automatically enabled in high channel density mode (HD).

Low-Pass Filter

Engages a 6 dB-per-octave filter above 12 kHz for attenuating undesired high frequencies, sometimes caused by sibilant vocals or paper rustling. Automatically enabled in HD mode.

Microphone Type
Displays the microphone type.

### Link/Unlink Buttons

For setting up a single audio channel. Links the microphone to the primary or secondary link slot (as selected at the top of the channel strip).

- **Link**: Links the microphone from the corresponding charging slot.
- **Unlink**: Unlinks the microphone from the audio channel.

### Bodypack Mic Options

There are two input sources available on the MXW1 bodypack: the internal, omnidirectional microphone or the external, TQG input for lavaliere or headset microphones. Select the input source preference:

- **Auto**: The internal mic is used until the MXW1 detects a connection at the TQG input. The microphone automatically selects the external source whenever available.
- **Internal**: Audio source is always from the internal microphone.
- **External**: Audio source is always from a connected microphone. (Internal mic is off.)

### Return Channels

Monitor the signal level and mute/unmute the audio of the return channel. Disabled in high density mode (HD).

### Configuration Tab

![Configuration Tab](image)

- **Group Row**
  
  Each row represents a Group in the Configuration. Select an APT and associate chargers and audio output devices to form each Group.

- **ID Button**
  
  Commands the selected device's LEDs to flash for easy identification.
③ Link Button

Links all microphones in the charger to channels in the associated Group.

④ Configuration Lock

Increases the number of MXW components that can operate on the same network. It is best practice to lock the configuration after setup to greatly reduce network traffic from MXW equipment. When systems exceed 15 APTs on the same network, configuration locking is required for stable performance.

Note: When selected, Groups are not editable on the Configuration page and the Utility page only displays information for devices belonging to this Configuration.

Link Microphones

Link all microphones in the charger to the access point audio channels.

Up to two microphones can link to each audio channel, though only one is on air at-a-time. Use the secondary link slot to add a microphone for battery redundancy or flexibility during events.

① Link Slot Selection

Up to two microphones link to each audio channel using the primary and secondary link slots. The secondary link slot is useful for an additional or alternate microphone that can be prepared before the event.

② Link Button

Links microphones in the charger to audio channels.

③ Cancel Button

Cancels the link procedure.
Utility Tab

1. **Export Button**

   Exports MXW device data to a text file (.csv).

2. **Configuration Filter**

   When checked, the table displays data for only the devices that belong to the Configuration or are open for association. Uncheck the filter to view all MXW devices on the subnet.

   *Note: The filter is checked when the configuration is locked from the Configuration tab.*

3. **Group**

   Indicates the device's status in a Group:
   - 1 - 10: Device is associated to that Group in the Configuration
   - Open: Device is not associated to any group
   - None: Microphone is linked to an Access Point that has been removed from a group (deselected from the Group row in the Configuration tab)
   - Standalone: Audio Network Interface is set to Standalone mode, which restricts association to an APT group
   - Unknown: Microphone is linked to an APT that is powered off or connected to a different network
   - Other: Device is associated to a Group in a different Configuration

4. **Device**

   The device type or microphone channel.
   - APT: Access point transceiver; also displays the selected channel density mode (SD = standard, HD = high)
   - NCS: Network charging station, up to two per group (A or B)
   - Mic 1 - 8: Microphone for channels 1-8, up to two microphones per channel (primary or secondary)
   - Out: Device is not associated or linked to a group

5. **Type**
The device model number.

⑥ Name
Displays device name as defined in the Configuration tab or channel name as defined in the Monitor tab.

⑦ IP Address Control
Displays the IP Address of the control network interface (Shure control data).

⑧ IP Address Network Audio
Displays the IP Address of the Network Audio network interface (Dante digital audio data).

⑨ Battery Capacity
The microphone battery’s percentage of charge capacity as compared to a new battery.

⑩ Cycle Count
Number of charge cycles logged by the battery.

⑪ Firmware Version
Displays the device’s firmware version.

⑫ ID Button
Sends a signal to the device to flash its LEDs for easy identification.

⑬ Device Properties
Opens a window for editing the properties of an individual device. The button displays yellow when the properties have been edited for that device. The changes can be applied or cancelled from the Pending Changes Button on the Utility tab.

⑭ Pending Changes Buttons
These buttons apply or cancel any changes made to the device properties:

- **Apply All**: Confirms and executes all updates to device properties. At this time, the computer may lose connection to the control software.
- **Cancel All**: Clears all pending changes to the device properties.

**Device Properties**
Edit the settings for each device by opening the Device Properties window from the Utility tab. Device properties are edited individually, but are uploaded to the devices in bulk by selecting the **Apply All** button from the Utility tab. This ensures that the changes are deployed properly across the network.

Some settings vary depending on the device capabilities.
APT4 Properties Window

1 Device Name

Device names can be customized with up to 31 characters.

2 Push to Dante Name

Uses the device and channel name from the MXW web interface to overwrite the names in the Dante Controller (DC) software by Audinate.

*Note: Use with caution, as this could break the routing configuration previously made in DC, causing audio interruptions.*

3 Serial Number

The unique identifier used to register the device at the Shure website, guarantee the warranty, and troubleshooting with customer support.
④ **Reboot**  
The unit performs a power cycle.

⑤ **Factory Reset**  
Resets the device to default settings, clearing any MXW Group and Link associations. The password to access the control software will reset to `admin`.

⑥ **Network Interface(s)**  
View and adjust IP settings for the device's network interface(s). Network settings are different for each device. See the Networking section for configuring each MXW device.

- **Control**: Shure control (software interface operation, firmware updates, Shure Device Discovery application).
- **Network Audio**: Dante network audio (digital audio networking and Dante software).

⑦ **IP Mode**  
Sets IP mode of the selected network interface:

- **Auto (DHCP)**: For automatic assignment of IP addresses.
- **Manual (Static)**: For Static IP addresses.

⑧ **IP Settings**  
View and edit the IP Address, Subnet Mask, and Gateway for each network interface.

⑨ **MAC Address**  
The network interface's unique identification.

⑩ **Density Mode**  
Sets the density mode set on the APT:

- Standard density (default)
- High density (doubles the available channels)

⑪ **RF Mode Settings**  
For APT2 and APT4 installed in adjacent rooms, alternate modes (Mode A, Mode B) to get the best RF performance.

⑫ **Add Updates**  
Select Add Updates to save the device changes to the control software. All device properties are updated simultaneously from the Utility tab. Once saved, the device will show Pending under the Properties column.

⑬ **Cancel Updates**  
Remove any changes made to the device properties.
Preferences Tab

All preferences apply to each device in the Configuration.

1 Switch Behavior

Customize the switch on each transmitter type.

- **Toggle (default):** Press and release the button to change the status to Active or Mute.
- **Push-to-talk:** Hold button to pass audio.
- **Push-to-mute:** Hold button to mute the audio.
- **Disabled:** The button does not affect the audio.

2 Initial State from Charger

Assigns the state for the transmitter after it has been removed from the charger:

- **Active:** On and passing audio to the network.
- **Mute:** On but the audio is muted.
- **Standby:** On but in a 'sleep' state with audio muted. Standby conserves battery charge and enables a change to the transmitter's status from the control software.
- **Off:** Power is off. A transmitter in this state cannot be remotely controlled by the software.

*Note: These settings only apply to standard mode; transmitters in high efficiency mode are always powered off when removed from the charger.*

3 LED Behavior

Set the behavior of the mute/active LED for each transmitter type. Standby mode is always represented with a pulsing red LED.

<table>
<thead>
<tr>
<th>Active</th>
<th>Mute</th>
</tr>
</thead>
<tbody>
<tr>
<td>Solid Green*</td>
<td>Solid Red</td>
</tr>
<tr>
<td>Solid Red</td>
<td>Flashing Red</td>
</tr>
</tbody>
</table>

80/103
Active | Mute
--- | ---
Solid Red | Off
External LED Control

*Not available for MX400R series gooseneck microphones*

⑤ Mute Preference
- **Local Mute - Individual (default):** Each transmitter is muted individually.
- **Local Mute - All:** All transmitters mute when any transmitter is muted.
- **External Mute:** Transmitter audio is on, and muted from a 3rd-party controller.

⑥ RF Power
Determined the RF coverage of an access point.
- **Low:** 25 ft (1mW)
- **Medium:** 50 ft (3 mW)
- **Medium High:** 100 ft (16 mW)
- **Max:** 150 ft (80 mW)

⑦ Out of Range Alarm
When enabled, a transmitter will audibly beep when it is taken out of the RF coverage area. (Disabled by default.)

⑧ Back in Range Action
Transmitters can be set to automatically activate (default) or mute when they re-enter the RF coverage area.

⑨ Standby Mode
- **Local** (default): Transmitter can individually be activated.
- **Global:** All transmitters are activated at the same time from Standby mode.

⑩ Linking Preference
The Link procedure can be restricted to the control software by disabling the hardware Link button on the Networked Charging Station. By default, the Link button is enabled.

⑪ Identity Preference
Determines the way the transmitter responds when it is identified from the control software:
- **Enabled:** Beeps with flashing LEDs
- **Disabled:** Flashing LEDs only (no sound)

⑫ Language
Determines the language of the control software.

⑬ Password Setup
The default password for the device is 'admin'. The following describes access rights for each logon:

- **Admin** (default): Full monitoring and editing access. The Admin can enable or disable the Tech- and Guest-level logon.
Tech: Monitoring with limited editing access.

Guest: Monitoring only.

Save/Load Preferences
Saves the preferences of the Configuration as a file to the computer. The file can be loaded and will overwrite the settings for all devices in the Configuration.

Register the Product Link
Links to Shure website for product registration.

Control Software for the MXW Audio Network Interface
The MXW Audio Network Interface features a control software to manage the analog inputs and outputs of the MXW system, in addition to the 4-port gigabit switch on the back panel of the network interface.

By default, all MXW devices have the password 'admin' applied to the control software. When logging in for the first time, enter 'admin' into the field to log on as the administrator. The password can be changed from the Preferences tab.

Note: For optimal system performance, the control software should not be open to more than seven tabs or windows.

Log On Page

User
There are three security levels to the Control Software: Admin, Tech and Guest. By default, only Admin is enabled. Log on and go to the Preferences tab to manage the User log on.

Admin (default): Full editing rights. The Admin can enable or disable a Tech-level logon.

Tech: Partial editing rights, limited to microphone management on the Monitor tab.

Guest: Monitoring only.

Password
Enter the password to log on as an Admin or Tech. The default password is 'admin' for the Admin user. To change the password, log on as an Admin and go to the Preferences tab.

Keep Me Logged On Button
When selected, this allows the user to bypass the Log On page when reopening the control software.

Language Selection
Selects the language for the GUI. This setting will be saved to the computer.

Log On Button
Press the button to log onto the control software.

Note: Default password is 'admin'

Control Bar

Tabs
The software has an Inputs/Outputs tab for managing audio and a Preferences tab for system configurations.
② Identify Button
This button sends a command to the hardware to flash front-panel LEDs for easy identification.

③ Security Level
Displays the access level of the user: Administrator, Technician, or Guest.

④ Log Off
Logs the user out of the software.

⑤ Language Selection
Selects the language for the control software interface. This setting will be saved to the computer.

Inputs/Outputs Tab

① Channel Name
Channel name is customizable by clicking in the text box. Names can be up to 12 characters long.

② Input Gain Setting (A, B)
Sets the analog input gain level: Line (default) or Aux.

③ Input Audio Meter
Displays input audio levels prior to the analog-to-digital converter.

④ Mute Button
Mutes or unmutes the channel's audio. The button illuminates red when a channel is muted.

⑤ Output Gain
Sets the output gain level.

⑥ Output Audio Meter
Displays output audio levels prior to the digital-to-analog converter.

⑦ Attenuation
Output attenuation is adjustable in 1 dB increments.

⑧ Notes
Save project notes here, such as installation dates or IP information.

Preferences Tab

① Language
Selects the language for the control software when the ANI is in Standalone Mode. In Standalone Network mode, this is defined in the MXW System control software.

② Device Serial Number
Displays the device serial number.
③ Firmware Version
Displays the current firmware version of the device.

④ Reset Button
Reboots the device with factory default settings.

⑤ Register This Product Link
Click to register the device at www.shure.com to receive product and software updates.

⑥ Audio Routing Mode
- **MXW Mode**: Enables automatic channel routing when the device is a part of an MXW group (assigned from the MXW System control software).
- **Standalone Mode**: Channels must be routed manually with Dante Controller software.

⑦ Device Name
Device names can be customized with up to 31 characters, except ‘=’, ‘,’ or ‘@’.

⑧ Addressing Mode
- **Auto**: IP settings are Link-Local or automatically accepted from a DHCP server.
- **Manual**: IP settings (IP Address, Subnet Mask, and Gateway) are static and are entered manually.

⑨ MAC Address
Unique identifier assigned to each network interface.

⑩ Port 4 Mode
Configures the Port 4 of the network interface:
- **Switched Mode (default)**: Full Ethernet support on port 4.
- **Uplink Mode**: Only control data is transported. Multicast traffic for Dante digital audio and the Shure Web Device Discovery application is restricted.

⑪ Front Panel Lockout
Disables the front panel controls on the hardware. Channels can still be selected for monitoring at the headphone jack.

⑫ Password
The default password for the device is ‘admin’.
- **Admin (default)**: Full editing rights. The Admin can enable or disable a Tech-level logon.
- **Tech**: Rights are limited to the Inputs/Outputs page (hardware functions only).
- **Guest**: Monitoring only.

**Dante Software by Audinate**
Audinate software provides additional function and control of the Dante digital audio network. Visit Audinate’s website for instructions for download and installation.
Dante Controller
Dante Controller (DC) is free software by Audinate that is used to configure and manage a network of Dante devices. Use it to route channels between Dante-enabled devices and to monitor the status of the device, clock, and network.

**Important:** The MXWAPT must be the Dante clock master for the network. Do not change the clock master from the MXWAPT (default selection) to another device.

**Note:** DC software is not required for routing audio within the MXW system. Use caution when using DC, as changing settings may interfere with MXW system functionality.

Dante Virtual Soundcard
Dante Virtual Soundcard (DVS) acts as an audio driver used to monitor and record digital audio without additional equipment. DVS uses a computer's standard Ethernet ports to transmit and receive up to 64 channels from any Dante enabled device on the same network.

Firmware Updates
Firmware is embedded software in each component that controls functionality. Periodically, new versions of firmware are developed to incorporate additional features and enhancements. To take advantage of design improvements, new versions of the firmware can be uploaded and installed using the Shure Update Utility. Download the software from www.shure.com.

Perform the following steps to update the firmware:

**CAUTION!** Ensure the device has a stable network connection during the update. Do not turn off the device until the update is complete.

1. Connect the device and computer to the same network (set to the same subnet).
   - To update MXW transmitters, place them in the MXW Networked Charging Station that is connected to the same network.
   - If the MXW Audio Network Interface is connected via Port 4, ensure that the Network mode is set to Switched mode (default) from the Preferences tab of the ANI control software.
2. Open the Shure Update Utility application.
3. Click **Check For Updates...** button to view new firmware versions available for download.
4. Select the desired firmware and press **Download** to download it to the Firmware Library.
5. From the **Update Devices** tab, select the new firmware and press **Send Updates...** to begin the firmware update, which overwrites the existing firmware on the device.

Firmware Release Requirements
Microflex Wireless devices comprise a network with multiple communications protocols that work together to ensure proper operation. The recommended best practice is that all MXW devices are on an identical release. To view the firmware of each MXW device on the network, open the Utility page of the MXW control software.

The format for Shure device's firmware is MAJOR.MINOR.PATCH. (Ex. 1.6.2 where 1 is the Major firmware level, 6 is the Minor firmware level, and 2 is the Patch firmware level.) At minimum, **devices that operate on the same subnet should have identical MAJOR and MINOR release numbers.**

Troubleshooting
The following table offers typical solutions when troubleshooting the Microflex Wireless System.
## Audio

<table>
<thead>
<tr>
<th>Problem</th>
<th>Indicator</th>
<th>Solution</th>

## Additional Resources

For additional Troubleshooting assistance or further information on complex installations, contact Shure to speak with a support representative. In the Americas region, call Systems Support group at 847-600-8440. For users in other locations, go to www.shure.com to find support contact for your region.

For digital audio networking help, advanced networking guidelines and Dante software troubleshooting, visit Audinate’s website at www.audinate.com.

## Factory Reset

If a device isn't appearing on the network after trying troubleshooting methods, perform a reset on the specific hardware to return the device to default settings. Factory default settings are designed for automatic compatibility with other Shure networked devices.

*Note: A factory reset will clear any MXW Group and Link associations. The password to access the software will reset to admin.*
From the Hardware

**Access Point Transceiver**

Press and hold the recessed reset button for 10 seconds. The network audio status LED will briefly turn off to indicate the unit is rebooting.

*CAUTION: A factory reset deletes all Group associations and microphone Links saved in the device.*

**Audio Network Interface**

Press and hold the reset button for 10 seconds. The front panel LEDs will flash to indicate the unit is rebooting.

**Networked Charging Station**

1. Turn off the power switch.
2. Press and hold the Link button.
3. While holding the Link button, turn on the power switch.
4. Continue to hold the Link button for 12 seconds until the LED illuminates amber.

---

From the Control Software

1. Open the Utility Tab of the MXW control software.
2. Select the Edit Properties button for the device.
3. Select the factory reset check-box.
4. Select Add Updates to save the setting to the edits queue.
5. Repeat for any additional devices.
6. Press the Apply All to make changes to all devices with edited properties.

Safety Information

SAFETY PRECAUTIONS

The possible results of incorrect use are marked by one of the two symbols—"WARNING" and "CAUTION"—depending on the imminence of the danger and the severity of the damage.

<table>
<thead>
<tr>
<th></th>
<th>WARNING: Ignoring these warnings may cause severe injury or death as a result of incorrect operation.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>CAUTION: Ignoring these cautions may cause moderate injury or property damage as a result of incorrect operation.</td>
</tr>
</tbody>
</table>

**WARNING**

LISTENING TO AUDIO AT EXCESSIVE VOLUMES CAN CAUSE PERMANENT HEARING DAMAGE. USE AS LOW A VOLUME AS POSSIBLE. Over exposure to excessive sound levels can damage your ears resulting in permanent noise-induced hearing loss (NIHL). Please use the following guidelines established by the Occupational Safety Health Administration (OSHA) on maximum time exposure to sound pressure levels before hearing damage occurs.

<table>
<thead>
<tr>
<th>90 dB SPL</th>
<th>95 dB SPL</th>
<th>100 dB SPL</th>
<th>105 dB SPL</th>

<tbody>
<tr>
<td>at ½ hour</td>
<td>at 15 minutes</td>
<td>Avoid or damage may occur</td>
</tr>
</tbody>
</table>

**WARNING**

- Battery packs may explode or release toxic materials. Risk of fire or burns. Do not open, crush, modify, disassemble, heat above 140°F (60°C), or incinerate.
- Follow instructions from manufacturer
- Only use Shure charger to recharge Shure rechargeable batteries
- **WARNING:** Danger of explosion if battery incorrectly replaced. Replace only with same or equivalent type.
- Never put batteries in mouth. If swallowed, contact your physician or local poison control center
- Do not short circuit; may cause burns or catch fire
- Do not charge or use battery packs other than Shure rechargeable batteries
- Dispose of battery packs properly. Check with local vendor for proper disposal of used battery packs.
- Batteries (battery pack or batteries installed) shall not be exposed to excessive heat such as sunshine, fire or the like

**WARNING:** Danger of explosion if incorrect battery replaced. Operate only with AA batteries.

*Note:* Use only with the included power supply or a Shure-approved equivalent.

Important Product Information

The equipment is intended to be used in professional audio applications.

*EMC conformance testing is based on the use of supplied and recommended cable types. The use of other cable types may degrade EMC performance.*

*Changes or modifications not expressly approved by Shure Incorporated could void your authority to operate this equipment.*
Please follow your regional recycling scheme for batteries, packaging, and electronic waste.

*Note: This device is not intended to be connected directly to a public internet network.*

**Information to the user**

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions:

1. This device may not cause harmful interference.
2. This device must accept any interference received, including interference that may cause undesired operation.

These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and the receiver.
- Connect the equipment to an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

**Certifications**

This device complies with FCC Part 15.

This device contains licence-exempt transmitter(s)/receiver(s) that comply with Innovation, Science and Economic Development Canada's licence-exempt RSS(s). Operation is subject to the following two conditions:

1. This device may not cause interference.
2. This device must accept any interference, including interference that may cause undesired operation of the device.
L'émetteur/récepteur exempt de licence contenu dans le présent appareil est conforme aux CNR d’Innovation, Sciences et Développement économique Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes :

1. L'appareil ne doit pas produire de brouillage;
2. L'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

Japanese Radio Law and Japanese Telecommunications Business Law Compliance. This device is granted pursuant to the Japanese Radio Law (電波法) and the Japanese Telecommunications Business Law (電気通信事業法). This device should not be modified (otherwise the granted designation number will become invalid).

Conforms to electrical safety requirements based on IEC 60065.

This product meets the Essential Requirements of all relevant European directives and is eligible for CE marking.

The CE Declaration of Conformity can be obtained from Shure Incorporated or any of its European representatives. For contact information please visit www.shure.com

The CE Declaration of Conformity can be obtained from: www.shure.com/europe/compliance

Authorized European representative:
Shure Europe GmbH

Fax: +49-7262-92 49 11 4
Email: info@shure.de

Authorized under the FCC verification provision per Part 15b.

Industry Canada ICES-003 Compliance Label: CAN ICES-3 (B)/NMB-3(B)

Note: See the label located on the bottom side of the charger enclosure for the FCC marking, the CE marking, the RCM marking, and the electrical ratings.

Certified under FCC Part 15.

FCC: DD4MXW1, DD4MXW2, DD4MXW6, DD4MXW8, DD4MXWAPT4, DD4MXWAPT8.

Meets applicable requirements of RSS-213.
